SCHLAGEL

Patent # 5,970,891

Aggressively destroys the seed trench
 Helps prevent crusting and baking
 Firms soil around seed for better emergence
 No-till or conventional till operations
 High-tensile steel for durability & long life

Posi-Close Planter Wheels take the place of the closing wheels on your planter. They come with and use the same bearing that your planter has now, so parts are never a problem. Posi-Close Wheels are available for all major planter brands.

Posi-Close Wheels are designed to work well in conventional or no-till operations and prevent problems associated with planting in wet conditions. Their unique, patented design allows more pressure to be applied to the press wheels without the formation of a crust or side-wall compaction.

Posi-Close Wheels will break and aggressively collapse the seed trench around the seed then firm the soil over the seed, creating excellent seed-to-soil contact and leading to better seedling emergence and crop stand. A soft mulch is left over the seed bed to help prevent crusting and baking. The distance between wheels is adjustable to fit your needs. **Posi-Close Wheels** have a wider path than standard wheels, so side-hill planting where the planter unit's tailpiece can side-shift off the row becomes more practical. Also, the swept-back rods of the wheels allows shedding of trash.
